## 1. Dog Bones

The neighbor dogs, Festus the Mastiff and his friend Klondike the Alaskan Husky, have been spending a lot of their time burying bones in the park. See if you can "dig up" the locations of all the bones in this grid, then feel around for something else that Betty the Maltese wishes Festus and Klondike would learn to do instead.

Each number represents the number of bones that can be found adjacent to it. (including diagonally). No bones will be found in cells containing a number.
